

Teacher Guide: Week 2

One Word, Two Ideas: Why Ambiguity Breaks Arguments

12th Grade Long Logic Unit Based on Richard Whately's *Elements of Logic*

Week 2 Overview

Week 2 builds directly on the four-step analysis habit from Week 1 by focusing on one of the most common reasons arguments fail the “test” step: ambiguous or shifting terms. Students learn to notice when a key word is being used in two different senses (equivocation) and to fix the meaning of important terms before evaluating an argument. The week draws from Whately's treatment of terms and ambiguity while remaining practical and example-driven. In the revised twelfth-grade plan, students begin a recurring habit of testing words from *Macbeth* and *Julius Caesar*: fate, manhood, honor, ambition, liberty, and tyranny.

Essential Question

How can the same word mean two different things inside a single argument, and what can we do about it?

Student-Facing Materials

- *One Word, Two Ideas: Why Ambiguity Breaks Arguments* — student reading handout.
- *Week 2 Argument Lab: Fixing the Term* — practice identifying ambiguous terms, repairing arguments, and creating original examples.
- *Macbeth Lit-Anchor: Words That Lie Like Truth* — Shakespeare anchor passage for testing Macbeth's confidence in ambiguous prophecies: “none of woman born” and “Birnam wood ... shall come.”
- *Week 2 Logic Test: The Case of the Two-Faced Word* — puzzle-style assessment requiring students to identify equivocation, fix terms, retest arguments, and review the Week 1 four-step argument diagnosis.

Learning Goals

Students will be able to:

1. Define a term and explain how the same word can refer to different ideas.
2. Distinguish ambiguity from equivocation.

3. Identify when an argument relies on an unstated shift in the meaning of a key term.
4. Fix the meaning of a disputed term before testing an argument.
5. Repair an equivocal argument by making the term precise.
6. Apply the same term-fixing habit in a puzzle-test setting with fresh, unfamiliar notices.
7. Recognize that some apparent disagreements are actually disagreements about the meaning of words.
8. Build a portfolio term investigation using either a contemporary argument or a recurring Shakespeare anchor.

Key Vocabulary

term, meaning, ambiguity, equivocation, fix the term, context

Weekly Lesson Sequence

Day 1: Opening Question and First Read

- Begin with: “Can two people use the exact same word and mean completely different things?” Have students write a quick example.
- Introduce the idea that many arguments look strong only because a word quietly changes meaning.
- Read the first half of the student reading aloud or in pairs.
- Stop after the “bank” example. Ask: Why does the argument sound silly once the two meanings are pointed out?

Day 2: Finish Reading and Annotate Examples

- Finish the reading.
- Students mark every example and label the two different meanings of the key term.
- Complete Reading Focus questions 1–4.

Day 3: Term-Fixing Practice

- Use the Argument Lab. Students work in pairs to identify the ambiguous term in each argument and propose a fixed definition.
- Discuss: How does fixing the term change whether the conclusion follows?

Day 4: Macbeth Lit-Anchor: Words That Lie Like Truth

- Read the guided Act 4, Scene 1 apparitions passage from the lit-anchor.
- Put two phrases on the board: “none of woman born” and “Birnam wood ... shall come.” For each, ask: What meaning does Macbeth assume? What alternate meaning remains possible?
- Emphasize that Macbeth’s confidence depends less on a simple falsehood than on an unfixed phrase taken in the most comforting possible sense.
- Students begin the *Macbeth Equivocation Chart* portfolio artifact.

Day 5: Puzzle Test and Debrief

- Administer *The Case of the Two-Faced Word*. Remind students that the test is not asking them to be clever with puns; it is asking them to fix terms before trusting an argument.
- Students should complete the puzzle story and main diagnosis independently. If time remains, debrief one notice by asking: Which word changed meaning? Which conclusion stopped following once the term was fixed?
- Use the Macbeth bridge to connect the test back to the lit-anchor: Macbeth’s error is not merely that he hears false words, but that he treats one possible meaning as the only possible meaning.
- Students add the test or its corrected version to the logic portfolio as evidence of their term-investigation skill.

Lit-Anchor Teaching Notes

The Week 2 lit-anchor gives students the central literary version of equivocation. Macbeth is not merely tricked by statements that are false on their face. He is ruined by phrases that keep one promise to his ear while allowing another meaning in reality. That makes the passage especially useful for Whately’s lesson: fix the terms before trusting the conclusion.

- **Guided passage:** *Macbeth* Act 4, Scene 1, the apparitions’ warnings and promises.
- **Independent passage:** Act 5, Scene 8, Macbeth and Macduff, ending with Macbeth’s recognition that the fiends “palter with us in a double sense.”
- **Central logical pressure:** Macbeth hears broad protection where the words allow narrow exceptions.
- **Portfolio artifact:** Macbeth equivocation chart: phrase, Macbeth’s interpretation, alternate meaning, hidden assumption, effect on reasoning, and connection to Whately.

For “none of woman born,” students should see Macbeth’s assumed meaning: no human being can harm him. Macduff exposes the alternate meaning: not born in the ordinary manner. For “Birnam wood ... shall come,” Macbeth assumes a whole forest must uproot itself; the words can also be fulfilled by soldiers carrying branches. The common hidden assumption is that Macbeth’s first comfortable meaning is the only possible meaning.

Notes on Examples

The student reading deliberately uses a mix of light, obvious examples (“bank”) and more serious, debatable examples (“liberal education,” equality, and tolerance). The lab adds *Macbeth* and *Julius Caesar* examples so students see that ambiguity is not only a trick in silly arguments but a real issue in literature, public speech, and substantive disagreements. Encourage students to bring their own examples from current events, school debates, or Shakespeare.

Logic Test Answer Guide: The Case of the Two-Faced Word

The test assesses whether students can fix terms before applying the Week 1 follow-test. Strong answers should name both meanings precisely and explain why the conclusion no longer follows once the term is stabilized.

Part I: Main Notices

- **Fair Judge:** The two-faced word is *fair*. In the first use, *fair* means just, impartial, or conducted according to proper rules; in the second use, it means pleasant, clear, or not rainy. This is equivocation because the argument moves from one meaning to another. Rainy weather does not prove that the trial failed to be just or properly conducted.
- **Free Hall:** The two-faced word is *free*. First it means liberty or protected permission to speak; then it means without monetary cost. The conclusion does not follow. A right to speak does not by itself prove that speeches must cost nothing.
- **True Heir:** The two-faced word is *true*. First it means rightful or genuine; then it means accurate or honest. Speaking truly about the cabinet does not prove that Nora is the rightful heir.

Part II: Fix the Term

Accept any rewritten argument that keeps the key term in one clear sense. Students should also notice that a fixed term does not automatically make the argument sound. For example, if *free* means protected liberty, the speaker still needs a premise connecting protected speech to the price of attending an event.

Part III: Week 1 Review

For the gold-ink claim, the conclusion is that the rule must be wise. The stated reason is that the Head Tutor wrote it in gold ink. The hidden assumption is that an impressive appearance or official presentation proves wisdom. The conclusion does not follow; gold ink may draw attention, but it does not establish wisdom.

Part IV: Logic’s Limits

Logic can test whether *fair* is being used in two senses, whether a conclusion follows after *free* is fixed, and whether a hidden assumption is needed. Logic alone cannot decide whether the Head

Tutor was morally wise or whether Nora actually has a legal right to the cabinet without further facts or testimony.

Part V: Macbeth Bridge

Macbeth assumes that “none of woman born” means no human being can harm him. The phrase also allows the narrower meaning: someone not born in the ordinary manner. Macbeth’s hidden assumption is that his comforting interpretation is the only possible interpretation. This is dangerous equivocation because the phrase is not simply meaningless or openly false; it works by carrying a double sense that Macbeth fails to fix.

Assessment

Use the Week 2 logic test as a portfolio assessment of term investigation. Strong work should:

- identify the key ambiguous term;
- state both meanings accurately;
- explain why equivocation weakens the argument;
- fix a term before retesting whether the conclusion follows;
- preserve the Week 1 distinction among conclusion, stated reason, hidden assumption, and follow-test;
- distinguish what logic can test from what requires further facts, testimony, or judgment.

Connection to Future Weeks

This week prepares students for later work on propositions, syllogisms, fallacies (many of which rely on equivocation), and verbal versus real disputes. The habit of fixing terms will also make the study of propositions and syllogisms clearer when those weeks arrive.
